The Necessity and Challenges of IoT Gateway Performance Analysis

IoT Gateway Performance Questions

- What is it?
- Why is it important?
- What can we do today?
- What are the challenges?
- How do we solve the challenges?

Which Performs Better...

Lamborghini

Pickup Truck

... Towing a Big Boat?

Performance Depends on Work

- What's the **workload** to be measured?
 - A strictly defined **set of operations**
 - The workload must match the **usage model**
 - Critical because work can vary greatly
- What's the **metric** to be compared?
 - A quantifiable result indicating performance

What is a Benchmark?

Benchmarks provide a point of reference to compare measurements across common workloads.

Performance is measured by benchmarking

- Speed
 - How **fast** can I perform a certain amount of **work**?
- Throughput
 - How **much work** can I do within a given **time limit**?
- Responsiveness
 - What is the **latency** for an operation?

IoT Gateway Performance Today

How many sensors can be connected?

What kind of processing is the gateway doing?

What physical interfaces are needed?

Will this gateway perform better than another?

What are the bottlenecks?

How many communication protocols need to be supported?

What kinds and how much traffic is there?

Can this gateway meet the needs of my application?

We Need an IoT Gateway Benchmark

- **Lack of standards** to determine how well gateways might perform in verticals
 - Marketing and R&D want to build the best product to serve their targeted customer
- Lack of metrics for **apples-to-apples** gateway comparisons
 - Purchasing managers and solution developers want the best gateway for their application needs

GOAL

To provide standardized metrics for
evaluating IoT gateway performance in
various verticals

IoT Gateway Verticals

Automation

Media

Transportation

... Smart Factories, Healthcare, Energy, Education, Finance, and many more...

Example Use Cases

Feature	Automation	Media	Transportation
Lots of devices	yes		
Lots of protocols	yes		
Wi-Fi	yes	likely	likely
GPS			yes
CANbus			yes
Cellular			yes
Low Power	likely		yes
Graphics Processing		yes	
CPU Intensive	likely	yes	
Drives displays		yes	likely

IoT Gateway Benchmark Concept

- A variety of workloads
 - Target IoT verticals
- No single overall score
 - Rather a score for each vertical
- Client-server approach
 - Remote/distributed operation
 - Workloads generated across multiple physical ports
- Scalable framework
 - Common interface with plugins

Development Phases

Phase 1 – Local

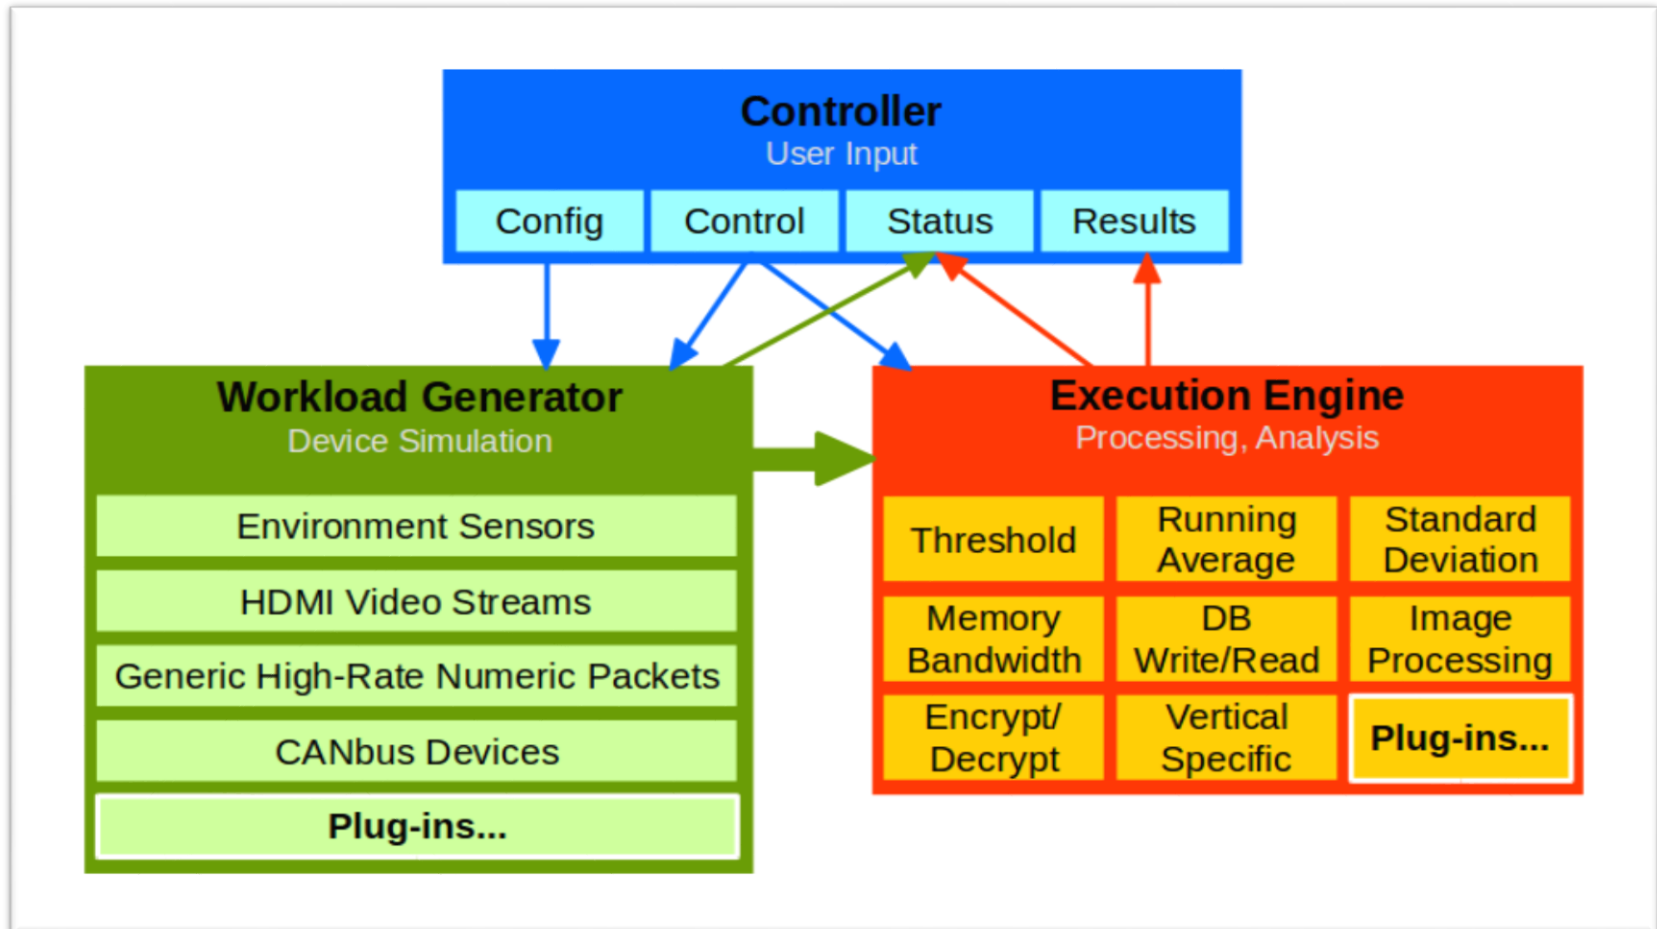

- Software only
 - No physical I/O
- Based on *typical* workloads
- Benchmark controller, workload generator, and execution engine *all run locally* on gateway

Phase 2 – Distributed

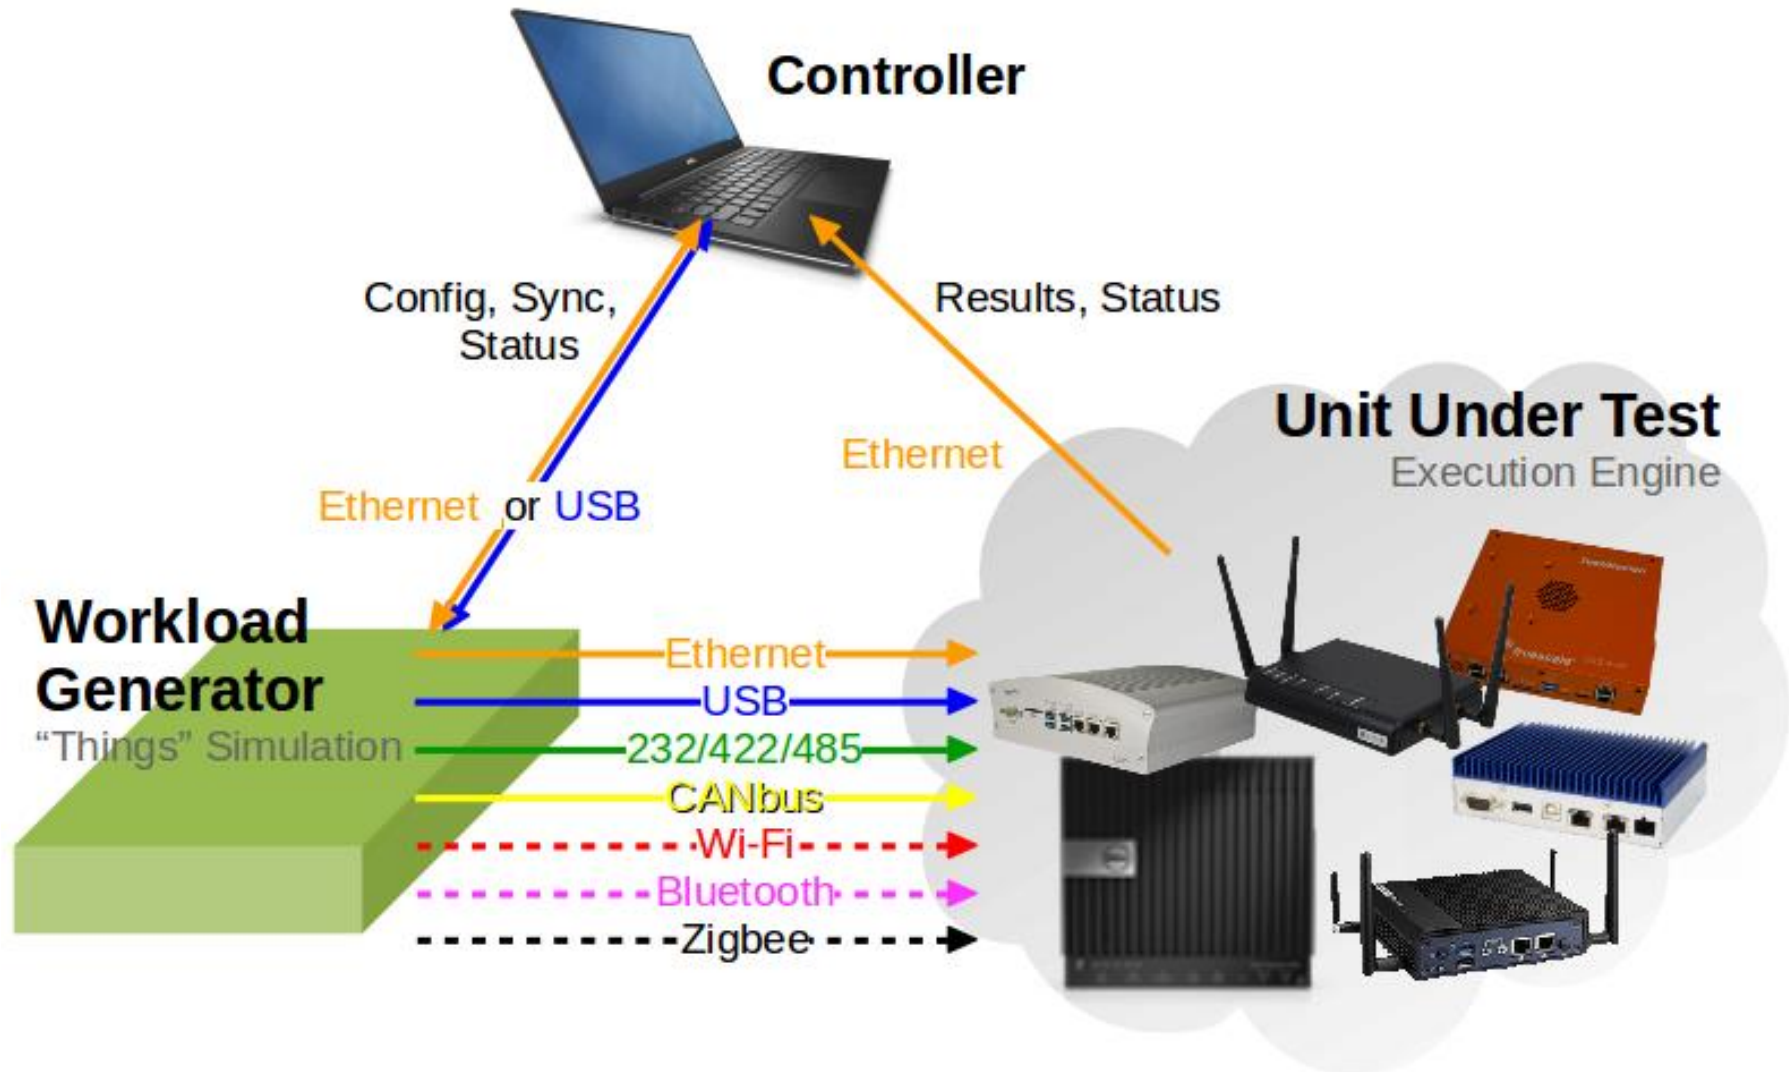

- Physical hardware is needed
 - Exercises physical I/O
- Hardware runs *real-world* workloads of profiled devices
- Controller runs on host PC
- Workload generator runs on *special benchmarking device*
- Execution engine runs on gateway

Phase 1 – Local

Gateway (Unit Under Test)

Phase 2 – Distributed

Challenges

- Defining valid workloads
- IoT is new
- IoT is fragmented
- Lack of industry standards
- Community involvement & adoption

Solving These Challenges

- Focus on *key verticals* first
- Involvement from key industry players
- Design scalable benchmark framework
- Well-documented requirements, next steps, owners, timelines
